

Prior to making your purchase, please consider the following:

- Assess your installation location. Stall bars should be mounted to a structural element in the building, such as a masonry wall, solid planked wall or other surface that can support the required loads. **Never mount Stall Bars to a sheet rock / plaster board wall!** When in doubt, consult a code official or building construction professional;
- Be sure the stall bars will fit in the space vertically. Measure the space carefully and compare to the dimensions on the web page. If unsure, please call for assistance;
- All Stall Bars require some minor assembly. If you plan on assembling outside the room in which they are to be installed, be sure to measure doorways, hallways, etc, so the completed assembly will fit once assembled! This is especially important for double stall bar assemblies;
- Consider the material of the Stall Bar – does it match your current furniture? We offer most products in Pine, Beech and Red Oak;
- If you are considering using the stall bars for rehabilitation and physical therapy, we recommend the 221-Rehab unit.

Please take care, a lot of exercises on Stall Bar are made with Hand raised.
